Making graphs

Our data

- To illustrate making graphs, we need some data.
- Data on 202 male and female athletes at the Australian Institute of Sport.
- Variables:
 - categorical: Sex of athlete, sport they play
 - quantitative: height (cm), weight (kg), lean body mass, red and white blood cell counts, haematocrit and haemoglobin (blood), ferritin concentration, body mass index, percent body fat.
- Values separated by tabs (which impacts reading in).

Packages for this section

library(tidyverse)

Reading data into R

- Use read_tsv ("tab-separated values"), like read_csv.
- Data in ais.txt:

```
my_url <- "http://www.utsc.utoronto.ca/~butler/c32/ais.txt"
athletes <- read_tsv(my_url)</pre>
```

```
## Parsed with column specification:
## cols(
     Sex = col character(),
##
     Sport = col_character(),
##
##
    RCC = col double(),
##
    WCC = col double(),
    Hc = col double().
##
##
    Hg = col double(),
    Ferr = col_double(),
##
    BMI = col double().
##
##
     SSF = col double(),
    `%Bfat` = col_double(),
##
##
    LBM = col double().
##
     Ht = col double(),
     Wt = col double()
##
## )
```

Types of graph

Depends on number and type of variables:

Categorical	Quantitative	Graph					
1	0	bar chart					
0	1	histogram					
2	0	grouped bar charts					
1	1	side-by-side boxplots					
0	2	scatterplot					
2	1	grouped boxplots					
1 2		scatterplot with points identified by					
		group (eg. by colour)					

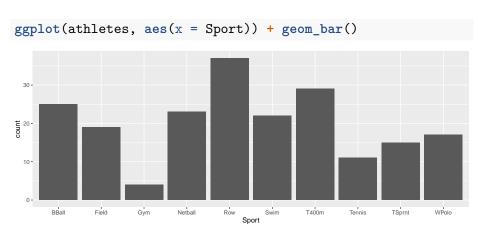

With more variables, might want *separate plots by groups*. This is called facetting in R.

ggplot

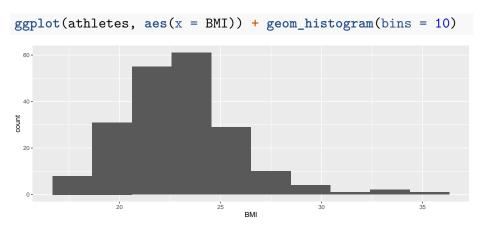

- R has a standard graphing procedure ggplot, that we use for all our graphs.
- Use in different ways to get precise graph we want.
- Let's start with bar chart of the sports played by the athletes.

7 / 17

Bar chart

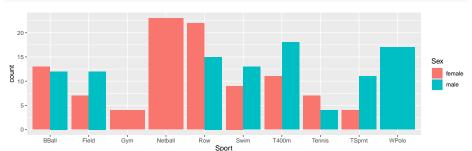

Histogram of body mass index

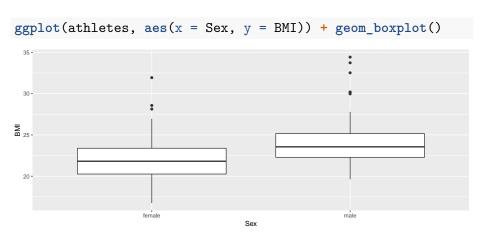

Which sports are played by males and females?

Grouped bar chart:

```
ggplot(athletes, aes(x = Sport, fill = Sex)) +
  geom_bar(position = "dodge")
```

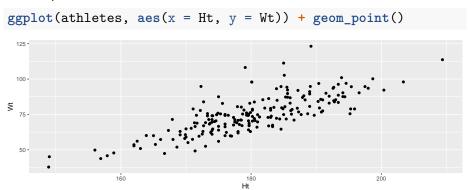

BMI by gender

Height vs. weight

Scatterplot:

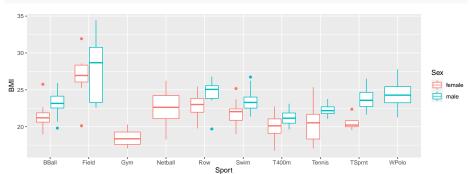

With regression line

```
ggplot(athletes, aes(x = Ht, y = Wt)) +
  geom_point() + geom_smooth(method = "lm")
## `geom_smooth()` using formula 'y ~ x'
 125 -
 100 -
 50 -
                                   180
                                                       200
```

BMI by sport and gender

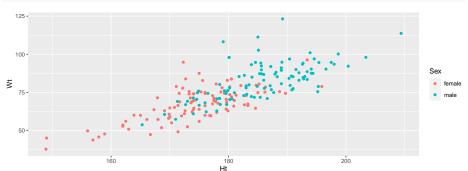

ggplot(athletes, aes(x = Sport, y = BMI, colour = Sex)) +
 geom_boxplot()

Making graphs 14 / 17

Height and weight by gender

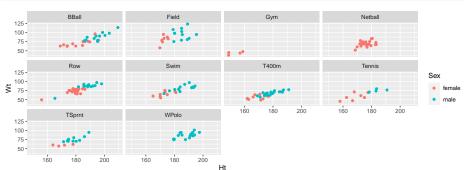

```
ggplot(athletes, aes(x = Ht, y = Wt, colour = Sex)) +
  geom_point()
```

Making graphs

Height by weight for each sport and gender, with facets

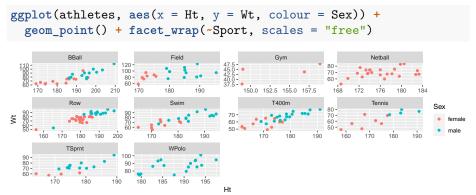

Making graphs

16 / 17

Filling each facet

Default uses same scale for each facet. To use different scales for each facet, this:

Making graphs 17 / 17
